

ANGRY FUZZ

Version 05/2010

Angry Fuzz is an original Visual Sound effect that will blow away any other fuzz pedal you've ever tried. Although it has an octave circuit which can be blended in with the fuzz, it is not at all like an Octavia or other vintage pedals. Set the volume and fuzz levels and turn the Bright switch on or off for your basic fuzz tone. The fun begins when you start blending in the octave circuit with the Anger Level knob. With single notes, it will give you an octave up.

However, play a two note chord and you'll get the octave up plus some wild lower octave artifacts. Try this:

- Play a 1 and 5 combination, you will also hear a note that is one octave down from the 1.
- Play a 1 and 4 combination, and you'll hear a note that is two octaves down from the 4.
- Play a 1 and 3 (major) combination, and you'll hear a note that is two octaves down from the 1.

This effect is even more pronounced when you roll off your guitar volume to about half. Crazy... and cool. And yes, it will make you play angry! Following are some settings to get you started:

Power with either a 9V alkaline battery or 9VDC regulated power supply like the 1 SPOT.
